2. If everything is set up correctly, you should see the WAMP Server homepage, confirming that the server is running.

Common Issues and Troubleshooting

While installing WAMP Server on Windows 7 is generally smooth, you may encounter some common issues. Below are potential problems and their solutions:

Issue 1: WAMP Server Icon is Yellow or Red

- Solution: This indicates that one of the services (Apache or MySQL) is not running. Check the following:
 - Ensure that no other applications (like Skype) are using the same port (usually port 80 for Apache). You can change the Apache port in the `httpd.conf` file located in the `C:\wamp\bin\apache\apachex.x.x\conf` directory.
 - Restart WAMP Server after making any changes.

Issue 2: Access Denied Errors

- Solution: If you encounter access denied errors while trying to access `http://localhost`, modify the `httpd.conf` file to allow access:
- Open the `httpd.conf` file in a text editor.
- Locate the section that reads:
`
`

```
Options Indexes FollowSymLinks  
AllowOverride all  
Require local  
  
`
```

- Change `Require local` to `Require all granted` to allow external access.

Issue 3: MySQL Not Starting

- Solution: If MySQL fails to start, check for any conflicting services:
- Open the Services application (`services.msc`) and ensure that no other database services are running on the same port (default is 3306).
- You can change the MySQL port in the `my.ini` file located in the `C:\wamp\bin\mysql\mysqlx.x.x` directory.
