Wall sits are an excellent isometric exercise that strengthens the thighs and improves endurance. Simply lean against a wall and slide down until your knees are at a 90-degree angle.

3. Push-Ups

Push-ups are a classic strength-building exercise that targets the chest, shoulders, and triceps. They can be modified to suit different fitness levels by adjusting hand placement or performing them on the knees.

4. Crunches

Crunches focus on strengthening the abdominal muscles. They can be performed on the floor or with a stability ball for added difficulty.

5. Squats

Squats are a compound movement that targets multiple muscle groups, including the glutes, quadriceps, and hamstrings. They can be enhanced by adding weights or performing different variations.

6. Lunges

Lunges improve lower body strength and stability. They can be performed forward, backward, or laterally to engage different muscle groups.

7. Leg Raises

Leg raises are excellent for targeting the lower abdominal muscles. They can be done lying flat on your back or hanging from a bar for added difficulty.

8. Planks

Planks are a core-strengthening exercise that also engages the shoulders and back. They can be modified by adjusting the duration or performing side planks.

9. Shoulder Stretches

Shoulder stretches help improve flexibility and reduce tension in the upper body. Simple stretches can be performed using just your body weight.

10. Tricep Dips

Tricep dips can be performed using a chair or a bench. They target the back of the arms and can be modified for various fitness levels.

11. Side Leg Raises

Side leg raises primarily work the hip abductors, which are essential for maintaining balance and stability.

12. Calf Raises

Calf raises strengthen the muscles in the lower leg and contribute to better balance. They can be done on flat ground or on an elevated surface for added difficulty.
